Slide notes

GL Access Reports are similar to Report Flag Reports, with the added feature of indicating Tag Access with each Account. They are most helpful in evaluating GL based Reports, and we can easily check whether the correct Accounts have been included in the Report, whether no Accounts have been missed when they should be included, and whether any Accounts have been incorrectly included more than once.

		<u>Next</u>
	GL Access debugging with Document Writer	
	This tool is primarily used with Income Statement and Balance Sheet Report design and debugging. In these cases, it is useful to find a design, tag or template selection mistake by appraising from the debugging report(s) which Ledger Accounts have been accessed by the Report execution, which Accounts have not been accessed, and also which Accounts may have been accessed more than once. Any of these conditions can reveal why the Report is not producing the correct result.	
	In order to use this tool (and the Reports afterwards), it is necessary to set GL Debugging = ON during test execution of the Report. In this case, the system will remove prior access statistics, and during the execution test, will record each GL Account where a balance is accessed, and record the TAG that has done so. From the debugging Report(s) that can be performed afterwards, you can list	Make a copy - <u>Text Copy</u>
	a) all the Accounts, with Tags accessed b) all Accounts NOT accessed c) all Accounts accessed more than once d) all Accounts accessed more than twice	Search Phrase
	The Report(s) are available by BS and IS Flag order respectively, and by choosing the appropriate data selector at runtime, any of the 4 options listed above can be performed.	Search the IES web on-line documentation by typing a phrase, then choose "search".
		<u>Search</u>
Ser		
É	S Dec Key glaccess-help	

Slide notes

Although the system says the biggest use for these Reports are when we test Balance Sheet and Income Statement Reports, they are in fact useful for any GL based Reports. The important step to do is to use the GL debugging when testing the Report, and then to run the GL Access Report afterwards.

Slide notes

This is a sample of a GL based Report. All the numbers on this Report are derived from a selection of GL Accounts, and in fact, when we think about an Income Statement Report, we realize that each and every Income / Expense Account in the Chart of Accounts should be counted somewhere in the Report, and every Account should be counted only ONCE.

Slide notes

For every Account listed, the system indicates the Tag or Tags where this Account is counted, i.e. it's result used. In this example, if an Account is accessed by more than 1 Tag, then it is WRONG, and if an Account is not accessed by ANY Tag, then it is also wrong.

Slide notes

So that means we can see at least 2 problematic Accounts in this Report. We will need to visit those Tags to see what they select according to their logic, and in the case of the Account not being accessed at all, we will check the Account for it's Flag Settings, and see why it is not included where it is supposed to be included. In this way, the GL Access Reports are imminently helpful.
