

Example of a structured Account Code with segments: -

Slide notes: This is an example of a Chart Structure, which is really just a structured manner in which Ledger Accounts are coded. In this example, we see the Ledger Account Code consisting of 4 segments. In IES, we can work completely without a structure, and code our Accounts freely, or we can formalize 1 or multiple structures. The IES General Ledger is multidimensional and allows up to 36 different Ledger Code structures.
